Assignment 4

Name: Athena Tian

The paper “The HAM10000 dataset, a large collection of multi-source dermatoscopic images of common pigmented skin lesions” by Tschandl et al. describe a database of dermatoscopic images of skin lesions. I have provided a subset of this database to use for this assignment.

The data set consists of a metadata file containing information about the patient (sex, age), location of the lesion (localization) and image name. The following 7 lesions have been identified in the attached images by clinicians. They are listed in the ‘dx’ column in the metadata csv.

Lesion	Abbreviation
Actinic Keratoses and Intraepithelial Carcinoma	akiec
Basal cell carcinom	bcc
Benign keratosis	bkl
Dermatofibroma	df
Melanocytic nevi	nv
Melanoma	mel
Vascular skin lesions	vasc

Notes:

- Submit your assignment as a pdf printout of the Jupyter notebook.
- Limit your code to only what is neccesary to answer each question. Any workshopping or testing of code along the way should be deleted prior to final submission.
- Only print out direct answers to the questions.
- Limit responses to 3 decimal places
- Do not type text in a code cell. Use a markdown cell to add text if directed.
- Do not print out the ouptut of the gridsearchcv. Make sure verbose is set to 0 or left blank.
- Make sure you follow the best practices for coding.
- Make sure you label all axes and provide legends for plots with multiple lines.
- For any functions that may perform some sort of randomization, use a random state or random seed of 0.
- Do not copy the question directly into the AI coding assistant.

Question 1

Create a classifier that always classifies the lesion as the most common occurring lesion

- Plot a histogram of the occurrence of each type of lesion (2.5)

🔍 Verification Step 1a:

Before relying on your visualization, write a simple verification line using pandas `.value_counts()` to output the exact text counts of the `dx` column. In the markdown cell below your code, confirm that the peak of your histogram perfectly matches the highest numerical count from your raw data. (2.5 pts)

In [27]:

```
# Step 1: Import required library
import pandas as pd

# Step 2: Define the file path
file_path = "C:/Users/athen/Desktop/bme312/bme312a4/metadata.csv"

# Step 3: Load the CSV file
metadata_set = pd.read_csv(file_path)

# Step 4: Display the first few rows of the dataset
#print(metadata_set.head())

# Step 1: Count unique values in the 'dx' column
lesion_counts = metadata_set['dx'].value_counts()

# Step 2: Display the counts of lesion types
print(lesion_counts)

# Step 1: Import the matplotlib library for plotting
import matplotlib.pyplot as plt

# Step 2: Get counts of each lesion type
lesion_counts = metadata_set['dx'].value_counts()

# Step 3: Create the histogram
# Step 1: Import the matplotlib library for plotting
import matplotlib.pyplot as plt

# Step 2: Get counts of each lesion type
lesion_counts = metadata_set['dx'].value_counts()

# Step 3: Create the histogram
plt.figure(figsize=(10, 6))
bars = lesion_counts.plot(kind='bar', color='skyblue')
plt.title('Occurrence of Each Type of Lesion')
plt.xlabel('Lesion Type')
plt.ylabel('Count')
plt.xticks(rotation=45)
plt.grid(axis='y', linestyle='--')

# Step 4: Add text annotations to each bar
for bar in bars.patches:
    plt.text(bar.get_x() + bar.get_width() / 2,
             bar.get_height(),
             int(bar.get_height()),
```

```
             ha='center',
             va='bottom')

# Step 5: Show the plot
plt.show()

# Step 6: Confirm the peak of the histogram matches the highest count
max_count = lesion_counts.max()
most_common_type = lesion_counts.idxmax()
print(f'Most common lesion type: {most_common_type} with count: {max_coun

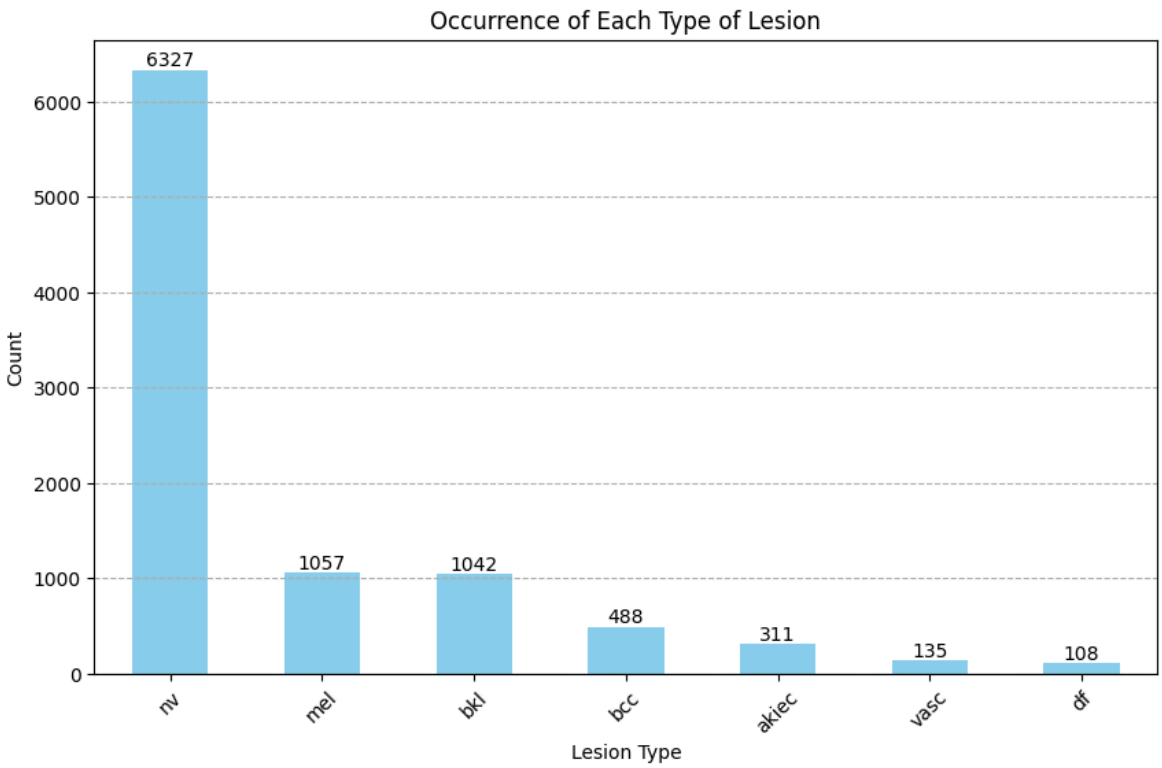
# Step 1: Find the most common dx value
majority_class = metadata_set['dx'].value_counts().idxmax()

# Step 2: Create a column for predictions based on the majority class
metadata_set['predicted_dx'] = majority_class

# Step 3: Calculate training accuracy
accuracy = (metadata_set['predicted_dx'] == metadata_set['dx']).mean()

# Step 4: Print the training accuracy rounded to 3 decimal places
print(f'Training accuracy of baseline classifier: {accuracy:.3f}')
```

```
dx
nv       6327
mel      1057
bkl      1042
bcc       488
akiec     311
vasc      135
df        108
Name: count, dtype: int64
```



```
Most common lesion type: nv with count: 6327
Training accuracy of baseline classifier: 0.668
```

Markdown cell: The most common lesion type printed shows 6327 instances of nv lesions, matching the graph.

- What is the training accuracy of this classifier? 0.668 is the training accuracy (2.5)

🔍 Validation Step 1b:

Calculate the theoretical baseline accuracy manually: take the total count of the most frequent class (from Step 1a) and divide it by the total number of rows in the dataset. Does the training accuracy returned by your AI-generated code match this theoretical calculation exactly? If there is a discrepancy, explain why in a markdown cell. (2.5 pts)

In [28]:

```
# Step 1: Find the most common dx value and its occurrences
majority_class = metadata_set['dx'].value_counts().idxmax()
majority_count = metadata_set['dx'].value_counts().max()

# Step 2: Calculate the total number of rows
total_rows = metadata_set.shape[0]

# Step 3: Calculate the proportion of the majority class
proportion = majority_count / total_rows
print(f'Proportion of most common type ({majority_class}): {proportion:.3

# Step 4: Calculate training accuracy again
accuracy = (metadata_set['predicted_dx'] == metadata_set['dx']).mean()
print(f'Training accuracy of baseline classifier: {accuracy:.3f}')

# Step 5: Calculate and print the discrepancy
discrepancy = proportion - accuracy
print(f'Discrepancy: {discrepancy:.3f}')
```

```
Proportion of most common type (nv): 0.668
Training accuracy of baseline classifier: 0.668
Discrepancy: 0.000
```

- What is the training sensitivity and specificity of this classifier for each class? (2.5)

🔍 Validation Step 1c:

Think about the logic of a majority-class baseline classifier. Theoretically, what *should* the sensitivity be for the majority class? What *should* it be for all other minority classes? (2.5 pts)

Sensitivity aka Recall has the purpose of measuring how well a model detects a class, when that class is actually present. Aka higher sensitivity means fewer cases/occurrences of a class were missed

Specificity measures essentially the opposite: how well does hte model reject the class, when it is NOT the correct class to be predicted. High specificy tmeans there are fewer false positives, or false detections/presences

Sensitivity for majority class should be 1.0 sine every true-majority class sample is correctly predicted. Sensitivity for non-majority classes should be 0.0, since all the true cases are missed. They all fall into false negative, since the model generalizes and never predicts the minority classes even if they are present in the dataset

In [29]:
```
# Step 1: Import necessary libraries for calculations
import numpy as np
import pandas as pd

# Step 2: Create a confusion matrix
confusion_matrix = pd.crosstab(metadata_set['dx'], metadata_set['predicte

# Step 3: Calculate sensitivity and specificity for each class
sensitivity = {}
specificity = {}
all_classes = metadata_set['dx'].unique()  # Get all unique classes from

for lesion_type in all_classes:
    TP = confusion_matrix.loc[lesion_type, lesion_type] if lesion_type in
    FN = confusion_matrix.loc[lesion_type].sum() - TP if lesion_type in c
    FP = confusion_matrix[lesion_type].sum() - TP if lesion_type in confu
    TN = confusion_matrix.values.sum() - (TP + FN + FP)

    # Handle cases for labels that exist in predictions but not in realit
    if lesion_type not in confusion_matrix.index:
        TP = 0
        FN = 0  # No true instances of this type
        FP = confusion_matrix[lesion_type].sum() if lesion_type in confus
        TN = confusion_matrix.values.sum() - FP  # All other instances ar

    # Calculate Sensitivity and Specificity
    sensitivity[lesion_type] = TP / (TP + FN) if (TP + FN) > 0 else 0
    specificity[lesion_type] = TN / (TN + FP) if (TN + FP) > 0 else 0

# Step 4: Create a summary table
sensitivity_df = pd.DataFrame(sensitivity.values(), index=sensitivity.key
specificity_df = pd.DataFrame(specificity.values(), index=specificity.key
summary_table = pd.concat([sensitivity_df, specificity_df], axis=1)

# Step 5: Print the summary table
print(summary_table)

# this is anticipated cause classifier is degenerate (aka constnat predic
# each class is either always correctly caught (majority) or never detete
# not the case in non-baseline things
```

```
       Sensitivity  Specificity
mel            0.0          1.0
nv             1.0          0.0
bcc            0.0          1.0
bkl            0.0          1.0
akiec          0.0          1.0
df             0.0          1.0
vasc           0.0          1.0
```

Question 2

Create a 'best' Random Forest Classifier using sex, age and localization as features.

- What hyperparameters should you select for creating a classifier that would best predict future data? (2.5)
  Answer: n_estimators to a higher nuber to reduce variance and improve performance, constrain max_depth to prevent memorizing noise.

The best hyperparameters from the grid search were as follows:
max_depth = 10, min_samples_leaf = 1, min_samples_split = 6, n_estimators = 300, Chosen from cross validation accuracy

🔍 Verification Step 2a (Data Integrity):

Because `sex` and `localization` are categorical variables, scikit-learn's Random Forest cannot process them as raw strings. Have the AI generate code to handle this preprocessing (e.g., using One-Hot Encoding). Before fitting the model, write a verification step to print out the first 3 rows or the columns of your processed feature matrix X. Verify that all categorical strings have been converted to numbers and that missing data (such as in `age`) was handled correctly. (2.5 pts)

In [30]:
```
# Step 1: Import necessary libraries
import pandas as pd

# Step 2: Select relevant features
features = metadata_set[['sex', 'age', 'localization']].copy()

# Step 3: Handle missing data in the 'age' feature
median_age = features['age'].median()
features['age'].fillna(median_age, inplace=True)

# Step 4: One-hot encode the categorical variables
features_encoded = pd.get_dummies(features, columns=['sex', 'localization

# Step 5: Assign X to the processed feature matrix
X = features_encoded

# Step 6: Print the first 3 rows and the columns of the processed feature
print("First 3 rows of the processed feature matrix X:")
print(X.head(3).astype(int))  # Convert to 0 and 1 for any boolean

print("\nColumns of the processed feature matrix X:")
print(X.columns)

# Step 7: Verify that all categorical strings are now numbers
print("\nData types of each column in processed feature matrix X:")
print(X.dtypes)

# Step 8: Verify for missing data in 'age'
missing_age_count = X['age'].isnull().sum()
print(f"\nNumber of missing values in 'age': {int(missing_age_count > 0)}

# Step 9: Print all features left in the matrix and their data types
print("\nFinal features and their data types in the processed feature mat
print(X.dtypes)  # Displays the data types of each feature left in the ma
```

```
First 3 rows of the processed feature matrix X:

dtype: object
```

```
C:\Users\athen\AppData\Local\Temp\ipykernel_28000\3547412866.py:9: FutureW
arning: A value is trying to be set on a copy of a DataFrame or Series thr
ough chained assignment using an inplace method.
The behavior will change in pandas 3.0. This inplace method will never wor
k because the intermediate object on which we are setting values always be
haves as a copy.

For example, when doing 'df[col].method(value, inplace=True)', try using
'df.method({col: value}, inplace=True)' or df[col] = df[col].method(value)
instead, to perform the operation inplace on the original object.

  features['age'].fillna(median_age, inplace=True)
```

🔍 Validation Step 2b (Grid Search Boundary Check):

Look at the optimal hyperparameter values chosen by your grid search/tuning script. If any chosen value sits right on the absolute minimum or maximum boundary of the parameter grid you searched over, your search space was too narrow. In a markdown cell, explicitly state whether your optimal parameters sit on the boundaries or safely within the interior of your defined search ranges. (2.5 pts)

In [31]:

```python
# dataset_factory.py
import os
import pandas as pd
import tensorflow as tf
import keras

def image_dataset_from_dataframe(
    dataframe,
    x_col,
    y_col,
    directory=None,
    image_size=(256, 256),
    batch_size=32,
    shuffle=True,
    seed=None,
    one_hot=True
):
    """
```

```python
    Keras 3 compatible wrapper that reads image paths from a dataframe,
    prepends a base directory, optionally one-hot encodes labels,
    and returns an optimized tf.data.Dataset.
    """
    df_working = dataframe.copy()

    # 1. Resolve image paths safely
    if directory:
        def _build_path(filename):
            path = os.path.join(directory, str(filename))
            if not os.path.splitext(path)[1]:
                path += '.jpg'
            return path
        file_paths = df_working[x_col].apply(_build_path).values
    else:
        file_paths = df_working[x_col].values

```
Best Hyperparameters:
{'rf__max_depth': 10, 'rf__min_samples_leaf': 1, 'rf__min_samples_split':
6, 'rf__n_estimators': 300}
Best Cross-Validation Score: 0.702

Best Hyperparameters with Boundary Status:
          Hyperparameter  Value On Boundary
0           rf__max_depth     10         Yes
1    rf__min_samples_leaf      1         Yes
2   rf__min_samples_split      6         Yes
3        rf__n_estimators    300         Yes
```

Optimal hyperparameters: Max depth = 10 = boundary value

Min samples eaf = 1 (boundary value)

Min samples split = 6 (not boundary value)

number of estimators = 300 (boundary value, when I increased the range to test also 400 and 500, the model became extremely slow to run, taking over 5 minutes each time)

- What is the training accuracy of this classifier? (2.5) 0.714

In [45]:
```
# Step 1: Calculate the training accuracy
training_accuracy = grid_search.score(X_train, y_train)

# Step 2: Print the training accuracy
print(f'Training Accuracy of the Random Forest model: {training_accuracy:
```

```
Training Accuracy of the Random Forest model: 0.714
```

- What is the training sensitivity and specificity of this classifier for each class? (2.5)

In [ ]:
```
# Step 1: Import necessary function
from sklearn.metrics import confusion_matrix
import numpy as np
import pandas as pd

# Step 2: Get predictions on the training data
y_train_pred = grid_search.predict(X_train)

# Step 3: Calculate the confusion matrix
conf_matrix = confusion_matrix(y_train, y_train_pred)

# Step 4: Initialize lists to hold sensitivity and specificity
sensitivity = []
specificity = []

# Step 5: Calculate sensitivity and specificity for each class
for i in range(len(np.unique(y_train))):  # Loop over each class
    TP = conf_matrix[i, i]  # True Positives
    FN = conf_matrix[i, :].sum() - TP  # False Negatives
    TN = conf_matrix.sum() - conf_matrix[i, :].sum() - (conf_matrix[:, i]
    FP = conf_matrix[:, i].sum() - TP  # False Positives

    sensitivity.append(TP / (TP + FN) if (TP + FN) > 0 else 0)
    specificity.append(TN / (TN + FP) if (TN + FP) > 0 else 0)

# Step 6: Create a DataFrame to display the results
results_df = pd.DataFrame({
    'Class': np.unique(y_train),
    'Sensitivity': sensitivity,
    'Specificity': specificity
})

# Step 7: Print the results table
print(results_df)
```

```
   Class  Sensitivity  Specificity
0  akiec     0.049587     0.998091
1    bcc     0.037234     0.999444
2    bkl     0.377381     0.953222
3     df     0.000000     1.000000
4    mel     0.101382     0.982553
5     nv     0.985938     0.320792
6   vasc     0.000000     1.000000
```

Question 3

In this question you will create and train a number of different neural networks. You will need to use a dataloader like we used in class, but slightly different.

Loading Images from a Pandas DataFrame in Keras 3

Because Keras 3 has deprecated the legacy `ImageDataGenerator` and its `.flow_from_dataframe()` method, loading image datasets directly from a tabular metadata file (like a CSV) requires a modern alternative. While Keras natively provides `image_dataset_from_directory`, it forces you to organize files rigidly into class-specific folders.

The custom helper function `image_dataset_from_dataframe` bridges this gap. It extracts file names and labels from a Pandas DataFrame, pairs them with a root directory, encodes categorical strings into integer targets, and constructs a highly optimized `tf.data.Dataset` pipeline compatible with JAX, PyTorch, or TensorFlow backends.

Function Parameters

The helper function accepts the following key arguments:

- **`dataframe`**: The Pandas DataFrame containing your metadata.
- **`x_col`**: String. The name of the column containing image filenames or relative paths (e.g., `'image_id'`).
- **`y_col`**: String. The name of the column containing the labels or targets (e.g., `'dx'`).
- **`directory`**: String. The absolute path to the folder where the physical images are stored.
- **`image_size`**: Tuple of integers `(height, width)`. The target dimensions to resize images upon loading. Defaults to `(256, 256)`.
- **`batch_size`**: Integer. The number of samples per training batch. Defaults to `32`.
- **`shuffle`**: Boolean. Whether to shuffle the dataset at initialization and after every epoch. Defaults to `True`.
- **`seed`**: Integer or `None`. Random seed for the dataset shuffling mechanism to ensure reproducibility.

Step-by-Step Usage Example

> ⚠ **Windows Pathing Note:** Always prefix your absolute directory string with an `r` (e.g., `r'C:\Users...'`) to create a **raw string**. This prevents Python from misinterpreting backslashes as escape characters (like the `\U` in `\Users`), which causes immediate syntax crashes.

1. Run the cell below containing the custom built file
2. Use the dataframe to create your dataset (see example python code)

In [ ]:
```
import pandas as pd
# Step 1: Import the os module
import os

# Step 2: Get the current working directory
current_directory = os.getcwd()

# Step 3: Print the current working directory
print(f'Current Working Directory: {current_directory}')

# Step 4: Change the working directory to a desired path (replace with yo
new_directory = "C:/Users/athen/Desktop/bme312/bme312a4"  # Replace with
os.chdir(new_directory)

# Step 5: Print the new working directory to confirm the change
print(f'New Working Directory: {os.getcwd()}')

from dataset_factory import image_dataset_from_dataframe

# Load your metadata file
df = pd.read_csv(r'C:/Users/athen/Desktop/bme312/bme312a4/metadata.csv')

# Define the path to the physical image directory (remember to use your p
image_dir = r'C:/Users/athen/Desktop/bme312/bme312a4/Images'

# Instantiate the optimized dataset pipeline
train_ds = image_dataset_from_dataframe(
    dataframe=df,
    x_col='image_id',
    y_col='dx',
    directory=image_dir,
    image_size=(256, 256),
    batch_size=32,
    shuffle=True,
    seed=0
)

# Visual check
import matplotlib.pyplot as plt
```

```
Current Working Directory: c:\Users\athen\Downloads
New Working Directory: C:\Users\athen\Desktop\bme312\bme312a4
Found 7 unique classes matching 'dx': ['akiec', 'bcc', 'bkl', 'df', 'mel',
'nv', 'vasc']
```

In [ ]:
```
# Step 1: Import necessary libraries CHECKING TO ENSURE IMAGES ARE PROPER
import os
from PIL import Image
import matplotlib.pyplot as plt
import pandas as pd

# Step 2: Load the metadata CSV file
df = pd.read_csv(r'C:/Users/athen/Desktop/bme312/bme312a4/metadata.csv')

# Step 3: Define the path to the physical image directory
image_dir = r'C:/Users/athen/Desktop/bme312/bme312a4/Images'
```

```python
# Step 4: Check if the image directory exists
if os.path.exists(image_dir):
    print(f'Image directory "{image_dir}" exists.')

    # Step 5: List all files in the directory
    files = os.listdir(image_dir)
    print(f'Files in the directory: {files}')

    # Step 6: Optionally display the first image if available
    image_files = [file for file in files if file.lower().endswith(('.png

    if image_files:
        print(f'Displaying image: {image_files[0]}')  # Print the first i
        image_path = os.path.join(image_dir, image_files[0])

        # Step 7: Open and display the image using PIL
        image = Image.open(image_path)
        plt.imshow(image)
        plt.axis('off')  # Hide axis
        plt.show()  # Display the image

    else:
        print("No image files found in the directory.")
else:
    print(f'Image directory "{image_dir}" does not exist.')
```

```
Image directory "C:/Users/athen/Desktop/bme312/bme312a4/Images" exists.

Model 1

Train a Convolutional Neural Network with a 32-kernel 3x3 convolutional layer, 1 5x5 max pooling layer, and a flattening layer prior to a Dense output layer. Run this model for 5 epochs. (10 pts)

🔍 Verification Step 3a (Data Pipeline Check):

AI assistants often default image pipeline targets to 256×256 or fail to structure separate generators properly. Before writing training code, extract a single batch from your training data loader using `imgs, lbls = next(train_generator)` and print out `imgs.shape`. In a markdown cell below, confirm that the dimensions are exactly $(Batch\,Size, 200, 200, 3)$ and that the code successfully identified exactly 7 output classes. (2.5 pts)

In [66]:

```python
# Step 1: Import necessary libraries
import tensorflow as tf
print(df.columns)

# Assuming 'train_ds' is defined as a tf.data.Dataset with the necessary
# Step 2: Adjust the dataset to resize images to (200, 200)
def resize_image(image, label):
    image = tf.image.resize(image, [200, 200])  # Resize image to (200, 2
    return image, label

image_dir = r"C:/Users/athen/Desktop/bme312/bme312a4/Images"

import pandas as pd
```

```
import os

# Example: Assume this is your existing DataFrame with the file_path alre
# df = pd.DataFrame({
#     'file_path': ['/path/to/images/image1.jpg', '/path/to/images/image2
# })

# If you already have the DataFrame, define image_id based on the filenam
df['image_id'] = df['file_path'].apply(lambda x: os.path.splitext(os.path

# Display the updated DataFrame
print(df)

df['file_path'] = df['image_id'].apply(
    lambda x: os.path.join(image_dir, f"{x}.jpg")
)

# Apply the resizing function to the dataset
train_ds = train_ds.map(resize_image)
import pandas as pd
import numpy as np
from sklearn.model_selection import train_test_split
from tensorflow.keras.preprocessing.image import ImageDataGenerator

# Step 1: Create a DataFrame (assuming you have a DataFrame named df)
# df should have columns: 'image_path' and 'label'
# Example structure:
# df = pd.DataFrame({
#     'image_path': [...],  # List of image file paths
#     'label': [...]        # Corresponding labels
# })

from sklearn.model_selection import train_test_split
from tensorflow.keras.preprocessing.image import ImageDataGenerator

# Step 2: Split the DataFrame into train, validation, and test sets
train_df, temp_df = train_test_split(df, test_size=0.3, random_state=42)
val_df, test_df = train_test_split(temp_df, test_size=0.5, random_state=4

# Step 3: Create ImageDataGenerators
train_datagen = ImageDataGenerator(rescale=1.0/255)  # Rescale training d
val_test_datagen = ImageDataGenerator(rescale=1.0/255)  # Rescale validat

# Step 4: Create data generators
train_generator = train_datagen.flow_from_dataframe(
    train_df,
    x_col='file_path',  # Use the file_path column for images
    y_col='class',      # Use the class column for labels
    target_size=(200, 200),  # Resize images to the desired size
    class_mode='categorical', # Change to 'binary' if using binary classi
    batch_size=32,
    shuffle=True        # Shuffle training data
)

val_generator = val_test_datagen.flow_from_dataframe(
    val_df,
    x_col='file_path',
    y_col='class',
    target_size=(200, 200),
    class_mode='categorical', # Change to 'binary' if using binary classi
```

```
    batch_size=32,
    shuffle=False  # Keep shuffling off for validation and test
)

[9468 rows x 4 columns]
Found 6627 validated image filenames belonging to 7 classes.
Found 1420 validated image filenames belonging to 7 classes.
Found 1421 validated image filenames belonging to 7 classes.
Class Names:  {'akiec': 0, 'bcc': 1, 'bkl': 2, 'df': 3, 'mel': 4, 'nv': 5,
'vasc': 6}
Shape checks passed. Images and labels are appropriately sized.
```

As shown above, the dimensions are now (32, 200, 200, 3) with 32 being set as the batch size. Labels shape indicates all 7 output classes (lesion types) were distinguished.

🔍 Validation Step 3b (Architectural Check):

Before executing your model fit loop, call `model.summary()` to output the layout of your neural network. Verify that the layer configurations perfectly match the specifications: a single 3x3 Convolutional Layer (with 32 filters), exactly one 5x5 Max Pooling Layer, a Flattening Layer, and a final Dense output layer. In your summary, look at the output dimensions of your Max Pooling layer to ensure the structural downsampling happened as intended. (2.5 pts)

In [71]:
```python
# Step 1: Import necessary libraries
import tensorflow as tf
from tensorflow.keras import layers, models

# Step 2: Define the CNN architecture with the updated convolutional laye
model = models.Sequential([
    # Convolutional layer with 32 filters, updated kernel size of 3x3
    layers.Conv2D(32, (3, 3), activation='relu', input_shape=(200, 200, 3

    # Max pooling layer with a size of 5x5
    layers.MaxPooling2D(pool_size=(5, 5), name='max_pool_layer'),

    # Flattening layer to reshape the output to a single dimension
    layers.Flatten(name='flatten_layer'),

    # Dense output layer with 7 units (for 7 classes)
    layers.Dense(7, activation='softmax', name='output_layer')
])

# Step 3: Print details of each layer
for layer in model.layers:

```

- Plot the training & validation accuracy as a function of the epoch for both model 3 and model 4 (5 pts).

- Why do you think model 4 does better than model 3? (5 pts)

Training for more epochs increases accuracy. The weights are refined more times, and later epochs can better tune towards an optimum. Deeper learning allows for learning of more complex patterns and features, while earlier layers are generally focused on rougher patterns and shapes. More epochs means the model can learn patterns better.

Model 5

Create your own model. Based on how the accuracy of the model changed between models 1 and 4, suggest a couple of tweaks to the model that you think might help. This model does not need to be optimal, but suggest changes in the model that might help. Do not spend too much time tweaking the model. Any changes that are sensible are good enough, even if accuracy goes down!! (5 pts)

Suggested tweaks:
should be a random forest model with higher n_estimators than 300.

Higher min_samples_split than 6, since these are both boundary values. Max_Depth and min_samples_leaf were also boundary values, but max_depth will remain constant to isolate the impact of the other hyperparamters changing.

Random forest was chosen since the accuracy was slightly lower than the convolutional neural network model 1 in question 3, it is significantly more computationally efficient, and there is the ability to perform cross validation rather than peeking directly at the test data to select hyperparameters. This decreases the risk of overfitting and improves generalizability.

In [46]:
```
# Step 1: Import necessary libraries
from sklearn.ensemble import RandomForestClassifier
from sklearn.model_selection import train_test_split, GridSearchCV
from sklearn.metrics import accuracy_score
```

```
# Ensure that preprocessing has been done before this step as per the pre

# Step 2: Define the feature matrix X and target variable y
# Assuming 'dx' is your target variable

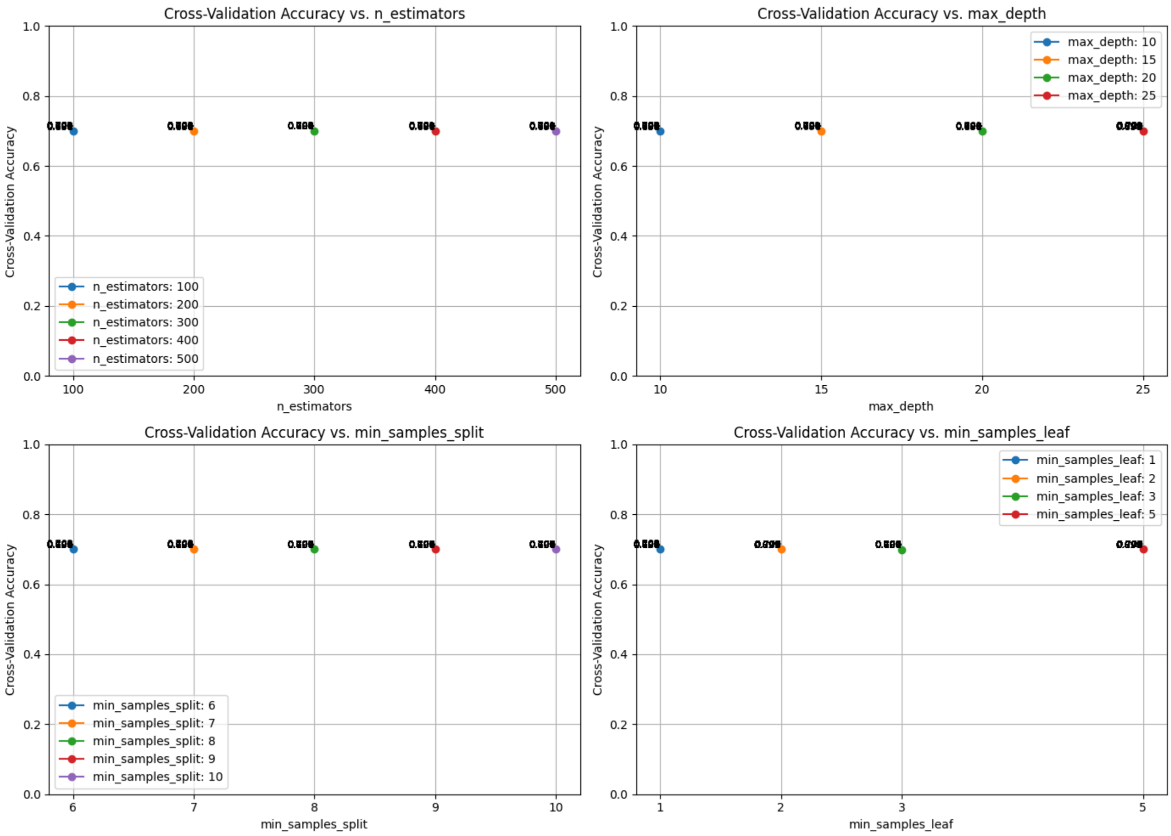
plt.xticks(sorted(leaf_scores.keys()))
plt.ylim(0, 1)
plt.legend()
plt.grid()

# Show all plots
plt.tight_layout()
plt.show()
```



Question 4

Of all the models you trained (Q1-Q3), which one should you select and how accurate do you expect it to be when applied to data it has not seen before? (5 pts).

Model 3, with accuracy of 0.7234 on test data

What are the test sensitivity and specificity (for each class) of this 'best' model? (5 pts)

In [76]:

```
import numpy as np
from sklearn.metrics import confusion_matrix

# Step 1: Make predictions on the test dataset using model_3
y_pred = model_3.predict(test_generator)

# Step 2: Get the predicted classes
y_pred_classes = np.argmax(y_pred, axis=1)  # Multi-class classification

# Step 3: Get the true labels from the test generator
y_true = test_generator.classes

# Step 4: Calculate confusion matrix
cm = confusion_matrix(y_true, y_pred_classes)

# Step 5: Calculate sensitivity and specificity for each class
sensitivity = cm.diagonal() / cm.sum(axis=1)  # Sensitivity for each clas
specificity = (cm.sum() - cm.sum(axis=1) - cm.sum(axis=0) + cm.diagonal()

# Step 6: Print sensitivity and specificity for each class
for i in range(len(sensitivity)):
```

```python
    print(f"Sensitivity (Recall) for class {i}: {sensitivity[i]:.4f}")
    print(f"Specificity for class {i}: {specificity[i]:.4f}")
```

```
45/45 ━━━━━━━━━━━━━━━━━━━━ 10s 228ms/step
Sensitivity (Recall) for class 0: 0.0000
Specificity for class 0: 1.0000
Sensitivity (Recall) for class 1: 0.0500
Specificity for class 1: 0.9918
Sensitivity (Recall) for class 2: 0.4770
Specificity for class 2: 0.8990
Sensitivity (Recall) for class 3: 0.0000
Specificity for class 3: 1.0000
Sensitivity (Recall) for class 4: 0.2763
Specificity for class 4: 0.9716
Sensitivity (Recall) for class 5: 0.9456
Specificity for class 5: 0.5475
Sensitivity (Recall) for class 6: 0.5652
Specificity for class 6: 0.9993
```
